OpenClaw Extra Butter

A quick look at the StartOS package: OpenClaw with a bundled Qdrant memory, helper agents, built-in rbw credential handling, connectors to services you already run, and a mobile webchat.

The service dashboard

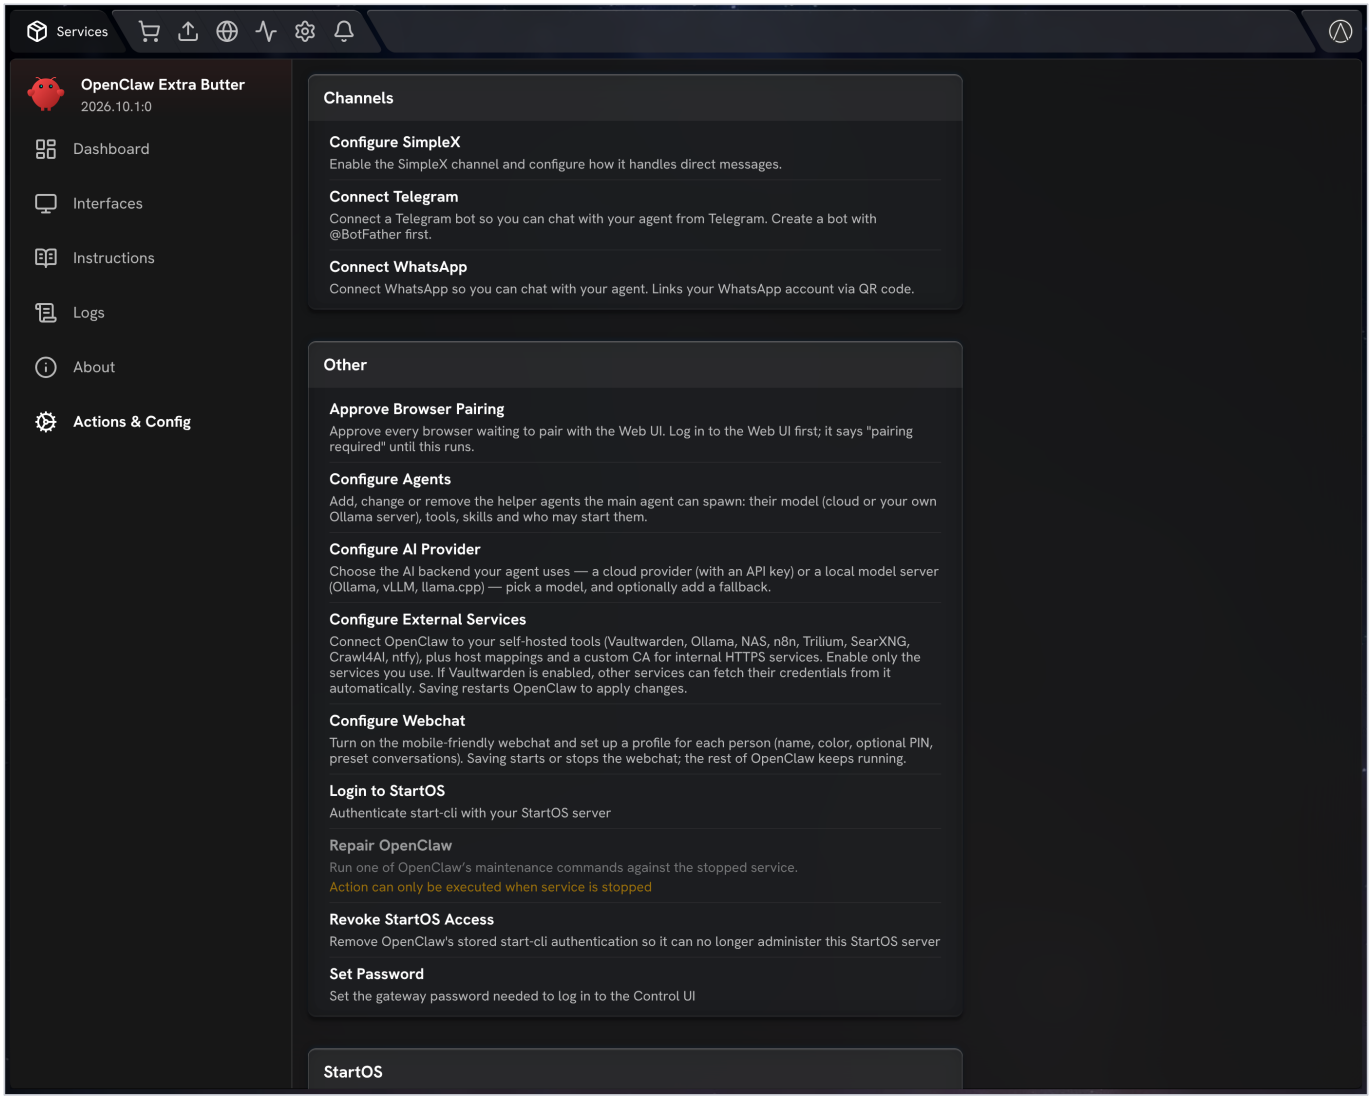

Every external service you enable gets its own health check on the StartOS dashboard, next to the gateway, Qdrant, the vault and the webchat, so a broken connection shows up where you already look.

Actions & Config

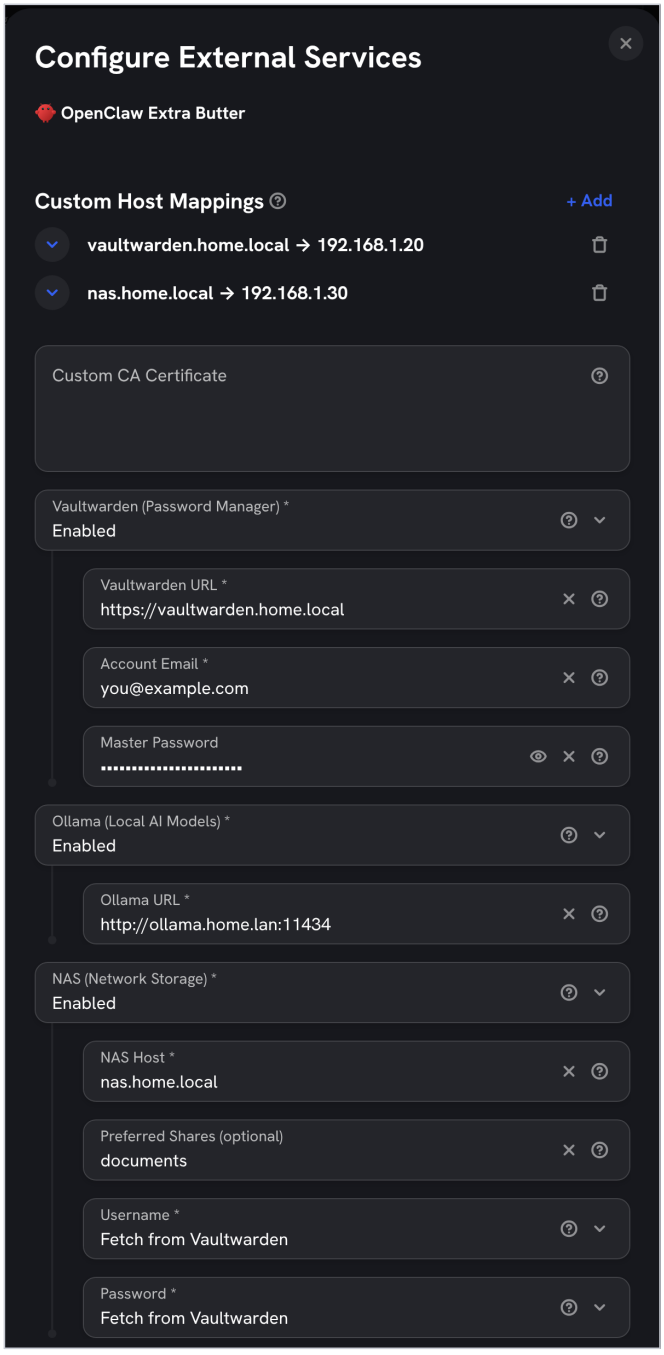

Setup and day-to-day changes are StartOS actions: AI provider, helper agents, external services, webchat profiles, chat channels (Telegram, WhatsApp, SimpleX), browser pairing, and an optional, off-by-default StartOS login for start-cli.

Configure External Services

One form connects the agent to your self-hosted tools. Each service is optional and independent. With Vaultwarden enabled, the built-in rbw client fetches the other services' credentials from your vault ("Fetch from Vaultwarden") instead of storing them in plain config. Host mappings cover *.local* names that StartOS won't resolve inside a service, and a custom CA covers internal HTTPS.
